Lake Michigan Wind Assessment Project

Data Summary and Analysis

May 2013

Part I – 2013 Data

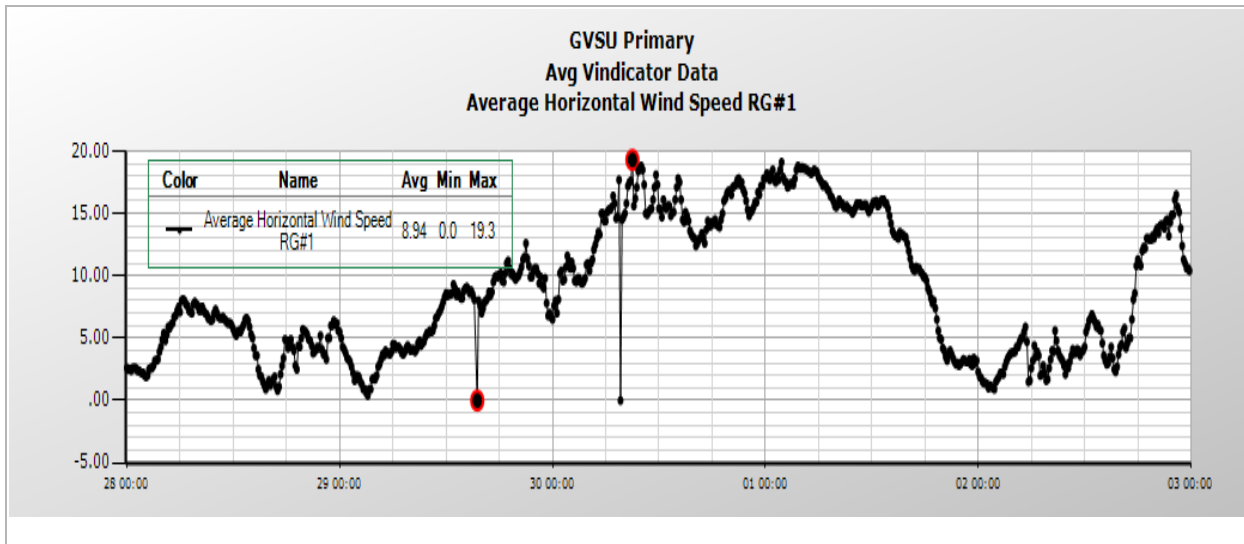

This report summarizes the data collected by the Laser Wind Sensor (LWS) #8 with collection information as follows.

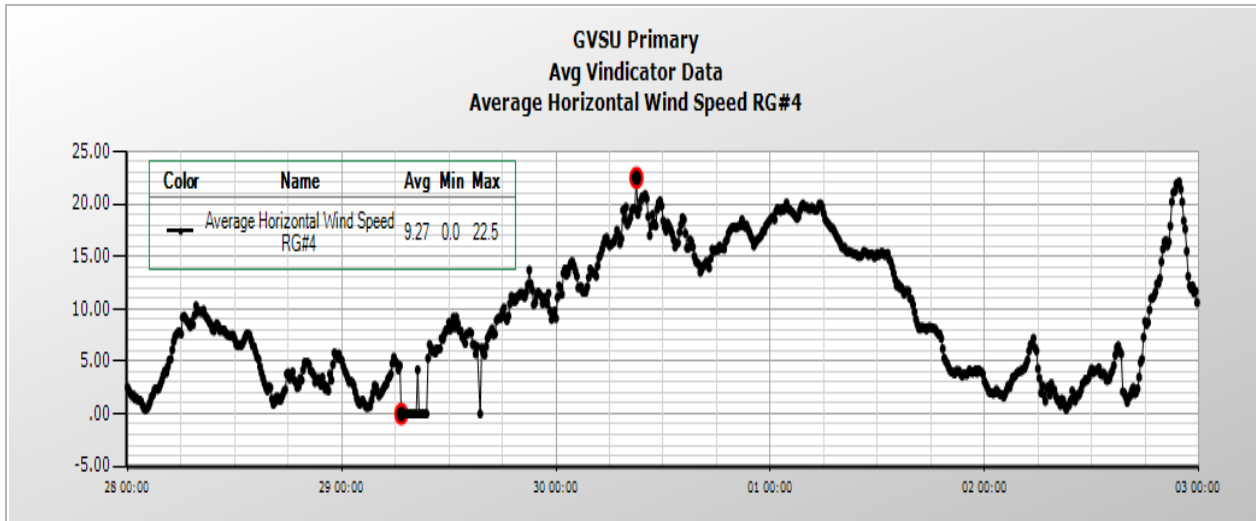

Location:	Lake Michigan – Near Muskegon (4316.542N, 8630.347W)
Date:	April 28 through May 31, 2013 (UTC)
Range Gates 1-6:	75, 90, 105, 125, 150, 175 meters
Cup Anemometer:	3 meters mounted on the buoy
Observations:	10-minute averages
Number of Observations:	34 days at 6 observations per hour = 4896 observations
Missing Observations:	1, (4/29/2013: 15:20)
Good Observations:	4895

Notes:

- o Range Gate 6 (175 meters) is a test range gate to observe the performance of the sensor at the extreme operating height limit for this configuration. Thus, performance degradation was expected.
- o All high resolution 1 second data for all wind speeds is stored onboard the buoy and can be used for further detailed post processing as required.

Graphs for wind speed for all ranges as well as the cup anemometer follow. Graphs of the horizontal wind direction at the cup anemometer and range gate 1 are included as well.

[Remove](#)

Summary statistics for wind speed by range gate and for the cup anemometer are shown in the following tables. Good observations are 10-minute averages consisting of at least 300 one-second observations. There were 4896 observations of 10-minute averages in total.

Table 1: Horizontal Wind Speed (meters per second) Statistics by Range Gate

Table 5 shows the 99% confidence intervals for the mean difference in average wind speed between adjacent range gates for example between the range gates centered at 175 meters and 150 meters. The difference is higher range gate – lower range gate. The confidence intervals are computed using the paired t method. An observation time is included in the difference if the number of observations for each of the two range gates was at least 300.

Table 5: Horizontal Wind Speed – Average Difference by Pairs of Adjacent Range Gates

Statistic	175m – 150m	150m-125m	125m-105m	105m-90m	90m-75m
Good Obs.	3706	4408	4658	4303	3994
% of Total (4896)	75.7%	90.0%	95.1%	87.9%	81.6%
Average	-0.16	0.026	0.12	0.23	0.49
99% CI- Lower Bound	-0.19	0.0055	0.10	0.21	0.46
99% CI Upper Bound	-0.13	0.046	0.13	0.26	0.51

Table 6 shows the energy generated for each range gate. The amount of energy generated depends on the turbine employed in this case the Gamesa Elioca G58 850kW. The energy estimate was computed assuming that the turbine will always face the wind.

Table 6: Energy (kWh/time unit) by Range Gate

Range Gate	Average Power (MW)	Average Daily Energy (MWh)
1	0.413	9.92
2	0.427	10.3
3	0.428	10.3
4	0.437	10.5
5	0.437	10.5
6	0.441	10.6
Buoy Cup	0.139	3.34

The wind rose graphs show the wind speed by direction as well as the percent of time the wind was blowing in each direction.

Range Gate 1: Average Wind Speed and Percent Time by Direction

Range Gate 2: Average Wind Speed and Percent Time by Direction

Range Gate 3: Average Wind Speed and Percent Time by Direction

Range Gate 4: Average Wind Speed and Percent Time by Direction

Range Gate 5: Average Wind Speed and Percent Time by Direction

Range Gate 6: Average Wind Speed and Percent Time by Direction

Buoy Cup Anemometer: Average Wind Speed and Percent Time by Direction

Notes:

1. The average wind speed at 75m and above is notably more than the average wind speed on the buoy deck. This conclusion is supported by the statistics in table 1, particularly the average and the median. Further, the data in table 2 show that about 90% of the time the wind speed on the buoy deck is 8m/s or less. For heights 75m and above, this is true about 50% of the time.
2. The average wind speed increases notably from 75m to 90m, slowly from 90m to 150m, and drops slightly from 150m to 175m as shown in table 4. Each difference is statistically significant ($\alpha = 0.01$) as shown in table 5. These data are inconsistent with the idea that power generation potential increases with turbine height. Instead the data suggest that a turbine height between 90m and 150m, perhaps closer to 90m than 150m, would provide a good balance between power generation and cost. This idea is consistent with the average daily energy values shown in table 6.
3. The highest frequency of wind direction as well as wind speed is SE through SSW, about 57% of the time as shown in table 3. In addition, the wind direction is NNW or NNE about 27% of the time.

Part II – Comparison of 2013 Data and 2012 Data

In this section, the data collected from May 8 through May 31, 2012 at the mid-lake plateau (4320.510N, 8707.206W) are compared to data from the same 24 days collected in 2013 as described above. The results are shown in table 7. Homogeneity of variance is assumed. Note that two variables are confounded regarding the comparison:

- Location (mid-lake plateau versus near Muskegon)
- Year (2012 versus 2013)

Table 7: Comparison of 2012 and 2013 Data

Statistic	N001S007 P006 Cup Anemome ter	N001S009 P083 75m	N001S009 P084 90m	N001S009 P085 105m	N001S009 P086 125m	N001S009 P087 150m	N001S009 P088 175m
2012							
Good Obs.	3456	3358	3401	3385	3113	1889	1215
% of Total (3456)	100	97.2	98.4	97.9	90.1	54.7	35.2
Average	4.9	9.9	10.1	10.1	10.1	11.7	12.1
2013							
Good Obs.	3456	2587	2904	3269	3300	3061	2356
% of Total (3456)	100	74.9	84	94.6	95.5	88.6	68.2
Average	5.1	9.1	9.4	9.3	9.5	9.7	10.1
Compare							
Average Difference	-0.20	0.80	0.70	0.80	0.60	2.0	2.0
Pooled Std. Dev.	2.4	5.1	5.2	5.3	5.3	5.5	5.3
99% CI– Lower Bound	-0.35	0.45	0.36	0.47	0.26	1.6	1.5
99% CI Upper Bound	-0.05	1.1	1.0	1.1	0.94	2.4	2.5

Notes:

1. The average wind speed at heights 75m through 175m is greater at the mid-lake plateau in 2012 than near to the shore in 2013. This is particularly true for heights 150m and 175m. All results are statistically significant ($\alpha = 0.01$).
2. The average wind speed is less at the mid-lake plateau in 2012 than near to shore in 2013 on the buoy deck. This result is statistically significant ($\alpha = 0.01$).
